

# Cell fate patterning in *C.elegans* VPCs

Xianfeng Ping, Chao Tang\*  
Center for Quantitative Biology, Peking University, Beijing 100871, China

## Introduction

### *C.elegans* VPC differentiation

### Signaling pathway

	Signal Pathway	Receptor	Ligand	Transmission Way
Inductive signal (IS)	EGF pathway	EGFR(LET-23)	EGF(LIN-3)	diffusible
Lateral signal (LS)	Notch pathway	Notch(LIN-12)	DSL-1, LAG-2, APX-1	membrane-bound

Signal transductions induce *C.elegans* VPCs patterning

## Model

topology follow function

$$\frac{dB}{dt} = V \frac{A^n}{A^n + k^n} - \frac{B}{\tau}$$

$$\frac{dB}{dt} = V \frac{k^n}{A^n + k^n} - \frac{B}{\tau}$$

### conditions

(1) S1=1, S2=0-0.5

(2) Different DSL/LAG2

(3) Two logic rules

## Result

### (1) Robustness constrain

The distribution of Q for S2=0.1, AND rule, only DSL

### (2) Prefer smaller S2 and more LAG2(membrane-bound)

### (3) Two types of topologies that can achieve the pattern
